FillDataSet Method

```
Public Function XXXXFillDataSet(ByVal dataSet As DataSet {ByVal
{ParameterName} As System.{ParameterType}}) As Long

' Copy input Parameter Values to the Parameter Collection
DIM vtParameter As Variant
vtParameter1 = {ParameterName}
Set
{AdapterInstance}.SelectCommand.Parameters.Item(ParameterName.Value)=vtParamet
er1
'Create an error handling block in case filldataset throws an exception
Try
'Load dataSet from the command
XXXXXFillDataSet = {AdapterInstance}.FillDataSet(dataset)
Catch eFillExeption as Exception
    'if we can do a debug.print without a reference, then we should print the
    'error info to the output window and re-throw the error.
End

End Function
```

UpdateDataSet Method

Public Function XXXXUodateDataSet (ByVal updateDataSet As DataSet) As Long

```
    const DataCursorRowState flag = DataCursorRowState.new |  
DataCursorRowState.Deleted | DataCursorRowState.ModifiedCurrent;  
    DataRow[] datarows = dataTable.Select(" ", " ", flag);
```

```
    Dim UpdateRows as DataRows()  
    Dim NewRows as DataRows()  
    Dim DeletedRows as DataRows()
```

```
    ' Get All of the Deleted Rows and Update the Data Store  
    DeletedRows = UpdateDataSet.Select(" ", " ", DataCursorRowState.Deleted)  
    If 0 < dataRowLength then  
        Update(DeletedRows, AdapterInstance.DefaultSourceTableName);  
    End If
```

```
    ' Get All of the Updates Rows and Update the Data Store  
    UpdatedRows = UpdateDataSet.Select(" ", " ",  
DataCursorRowState.ModifiedCurrent)  
    If 0 < dataRowLength then  
        Update(DeletedRows, AdapterInstance.DefaultSourceTableName);  
    End If
```

```
    ' Get All of the New Rows and Update the Data Store  
    NewRows = UpdateDataSet.Select(" ", " ", DataCursorRowState.New)  
    If 0 < dataRowLength then  
        Update(DeletedRows, AdapterInstance.DefaultSourceTableName);  
    End If
```

End Function
